This chartpack updates a prior analysis we released on December 8 regarding hospital demand and supply in North Carolina during the COVID-19 pandemic. Please refer to that brief for definitions of key terms and the regional structure, as well as details on our methods and data sources.

In our December 8 brief, we continued our use of the concept of a hospital capacity “runway,” that is, the number of weeks until demand for hospital services is expected to meet or exceed the available supply of staffed beds, assuming current conditions continue. Today’s updated results incorporate data through Saturday, December 19.

Compared to our analysis from two weeks ago, we have seen some moderate overall improvement. The acute hospital bed “runway” across North Carolina has extended somewhat to an 8-week runway now, up from the 6-week runway projected based on early December’s conditions. Thus, based on the most recent data, if present conditions continue, the need for acute hospital beds in North Carolina will reach the limit of staffed capacity in about two months.

This moderately longer runway illustrates how slowing the hospitalization growth rate makes a difference: in the last two weeks, the growth rate was lower (12.2%) than the prior rate (19.9%) seen in the two weeks before December 5.

Statewide, the runway of staffed Intensive Care Unit (ICU) beds remains unchanged from our prior brief (at about a 4-week runway if present conditions continue). Two weeks have passed since the last brief, so an unchanged runway projection means conditions have actually improved statewide relative to two weeks ago, though a one-month runway of staffed ICU beds statewide is still concerning.

Although the statewide numbers are slightly better now than they were two weeks ago, there are still several notable regional trends to monitor:

- The regional runways for staffed ICU beds in the Asheville, Triad, and Charlotte regions are each under 3 weeks.
- In our last brief’s analysis, the Charlotte region had four weeks of staffed ICU runway. We now project a 2-week staffed ICU runway in Charlotte, which is consistent with the 4-week runway projected in the prior brief two weeks ago; thus, conditions have not materially improved there.

Notably, near the intersection of the three Western regions (Asheville, Triad, and Charlotte), hospitals in the counties surrounding the city of Hickory (not shown) are especially close to reaching ICU capacity, with less than one week of runway available if present conditions continue.

There are concerns in other regions, too. In the Wilmington region, the acute hospitalization growth rate is now 34.3% as measured in the two prior weeks compared to just 12.3% in the two weeks prior to December 5.

The COVID-19 situation in North Carolina remains concerning, particularly in certain “hotspot” areas. All across North Carolina, there are ongoing concerns about the availability of health care workforce to staff hospital beds.

Of course, conditions can and often do change. When they do, the calculated hospital runway projection estimates also change, sometimes for the better (e.g., Greenville) and sometimes for worse (e.g., Wilmington acute and Triad ICU).

Hospitals respond to peak demands in a number of ways, including by transferring patients to other hospitals with more capacity or shifting health care personnel from one region to another to fill gaps. However, if many hospitals in a given region face shortages, opportunities to transfer patients or personnel are likewise limited.

Given the likelihood of holiday travel and gatherings seeding new COVID-19 cases (and eventually, more hospitalizations), these trends remain important to regularly monitor and manage. Notably, COVID-19 case growth has moderated overall, especially over the last week, an important, positive development.
